

One of the oldest ecosystems on earth

The Serengeti is one of the oldest ecosystems on earth; it protects the largest and most varied concentration of wildlife of the planet and is home to one of the biggest migrations that has occurred for millions of years; both vegetation and wildlife have not changed much since the time when the hominids lived in these lands, as witnessed by the remains found at Olduvai, which is better known as the “cradle of mankind”.

For millions of years about 1 and a half million wildebeests and 400,000 zebras have run every year on a circular track in the constant search for new pastures and water in what is known the Great Migration; on their way they encounter dangers and obstacles but their instinct guides them and makes them point to the ecosystem of the Serengeti.
